                                     8
                           0.120
```

```
abalone %>%
  ggplot(aes(x = age)) +
  geom_histogram()
```

## 'stat\_bin()' using 'bins = 30'. Pick better value with 'binwidth'.

As the histogram shown above, the distribution of age is approximately normal, with a tail on the right. And most of the abalone has the age around 10 in this data set.

# Question 2:

```
set.seed(2216)
abalone_split <- initial_split(abalone, prop = 0.80)</pre>
abalone_train <- training(abalone_split)</pre>
abalone_test <- testing(abalone_split)</pre>
dim(abalone_train)
## [1] 3341
               10
dim(abalone_test)
## [1] 836 10
Question 3:
```

```
head(abalone)
```

```

R-Squared means the proportion of the variance for a dependent variable that's explained by an independent variable or variables in a regression model.(cited from https://www.investopedia.com/terms/r/r-squared.asp)

Therefore, since the value of R-squared is 0.5639424, this means that 56.39424% of the response variable can be explained by predictor variables. However, this proportion does not seem to be great enough to make it a good regression model.
